This article summarises new discoveries and prominent stray finds that reached the institutional collections in 2011. The table in this article consists of 128 new sites, among which are 16 cemeteries, 44 settlement sites, 34 cup-marked stones, two manufacturing sites, three hoards, four sites of field systems and 28 stray finds (Table 1; Fig. 1).¹ New sites were discovered from most of the counties in Estonia, but some counties are much better covered than others.

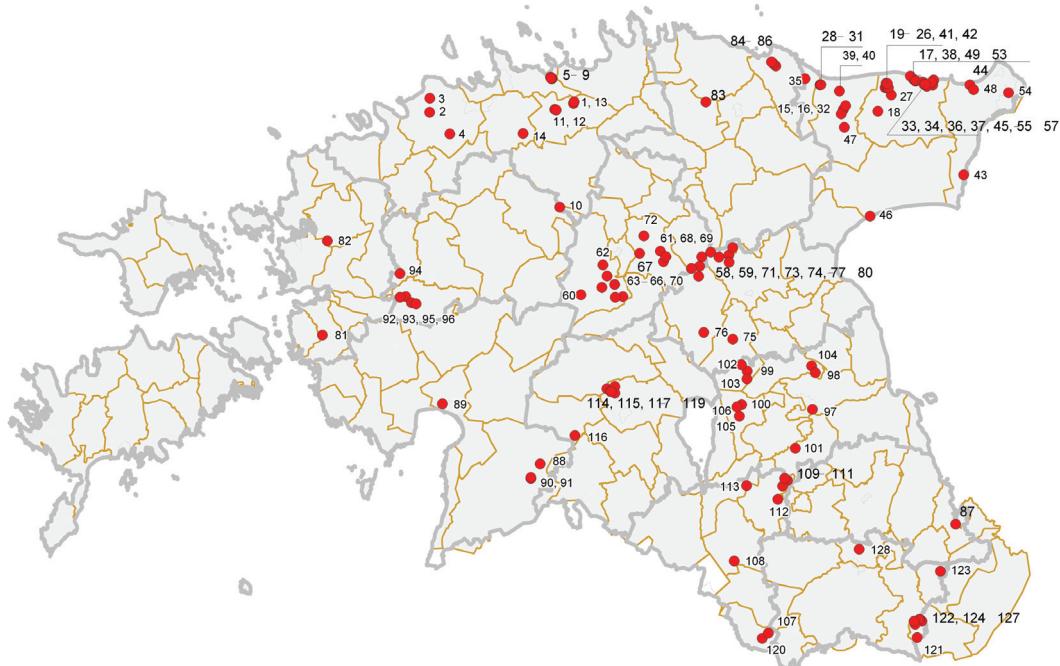

Fig. 1. New archaeological sites discovered in 2011.

Jn 1. 2011. aastal avastatud muistised.

Map / Kaart: Kalle Lange

¹ In some locations both a cemetery and a settlement site were discovered. This means that the overall number of the sites is smaller than the sum of various types of monuments.

The most prominent discoverer of new sites that year was again Andres Vindi (TÜ), who led and participated in several surveys that resulted with the discovery of 43 new sites. Tõnno Jonuks (EKM), who led several surveys in Ida- and Lääne-Viru County (see also Veldi & Jonuks, this volume), stayed on a second place with 35 new sites.

THE CONTRIBUTION OF THE PUBLIC AND METAL DETECTORISTS

In addition to archaeologists – whose duty is to locate new archaeological monuments – the contribution of local inhabitants and users of metal detectors has grown. It is our pleasure to see that cooperation between professional archaeologists and local inhabitants has proliferated. This is also seen in the growth of finds (16 in 2011) that reached the institutional collections. Most of the finds were discovered in Harju County. In 2011 an amended law of heritage protection came into force (see Kraut, this volume). It states that only people that have passed special training and have gained a licence from the National Heritage Board may search for finds with cultural value. This also means that they know how to handle finds and who to contact if something is discovered. The law also sets rules for reporting the results about their surveys yearly. This will hopefully result in more complete overviews in the near future.

Not all the finds have been discovered with the help of a metal detector. Dimitri Sutov found a Neolithic flint arrowhead from Tõrvajõe (No. 54) village in Vaivara municipality. Rene Vinkler, who has made several discoveries with the help of a metal detector, discovered grinding stones (No. 1) from Anija municipality.

Most of the finds have been discovered with the help of metal detectors. Roland Kolk found a hoard from Humala village in Harku municipality, Harju County (No. 2). The site was documented by Prof. Aivar Kriiska (TÜ). The find contained a woman's neck jewellery of bronze and two knife sheaths, belt decorations etc. from the 12th–13th century. Near that site Kolk also found a Roman coin (No. 3). Andrei Selivestov found a bronze arrow head from Permisküla (No. 43) in Ida-Viru County, Prof. Kriiska assisted in bringing the find to the collection of the University of Tartu. So far no parallels are known to the arrow head from the Baltic Sea region (Kriiska 2012, 2; Kriiska & Kuzminykh 2012).

From the Jõgisoo village in Saue municipality Jüri Ivanovtel found two weights (No. 4). Rene Vinkler discovered a cremation cemetery from the uppermost part of a field in Kadja in Kõue municipality, Harju County (No. 10). In most cases the finds there were deliberately broken and burnt (Fig. 2). Archaeologist Mauri Kiudsoo (AI) documented the site afterwards (Kiudsoo 2012). A similar monument was discovered at Vaida village in Rae municipality by Aivar Raudkepp (No. 14). Rene Vinkler has also discovered Partsare III cemetery (No. 13); and together with Rait Hutrov Linnakse II cemetery (No. 11), from the vicinity of monuments discovered in the previous years at Anija municipality (see Lõhmus & Ots 2011). Partsare cemeteries are discussed in another article of the present volume (Kiudsoo *et al.*, this volume). Erkki and Veiko Heinsalu found Linnakse III cemetery (No. 12) from the Anija municipality. A separate article in the present volume (Tamla *et al.*, this volume) is dedicated to a hoard discovered at Kinksi village in Hanila municipality during cultivation activities (No. 81).

Two new sites were discovered in Järva County. From Oisu municipality from a former farm Koosi Margus Tepner found a Late Iron Age cemetery (No. 63). Another case is not as much a new site in itself, but exceptional because of its discovery. In 2007 Raivo Vende discovered Sargvere settlement site, which was then excavated by Andres Tvaauri (TÜ) (see Tvaauri 2007; 2008). Unfortunately, the site is not under state protection at the moment. So, in 2011 a hobby archaeologist found a hoard (No. 67; Fig. 3; see also Tvaauri *et al.*, this volume) from the territory of the settlement site inhabited from the 12th to the 17th century. The hoard contained various jewellery and was placed to the ground in a wooden container during the Livonian War (1558–1583). It was taken to the laboratory of the University of Tartu as a block (Tvaauri 2011) where it was carefully analysed and documented (Tvaauri *et al.*, this volume).

Pappaare settlement site (No. 89) at Audru municipality in Pärnu County was discovered during the excavation of a trench (Puuram 2011). In addition to pottery sherds the discoverer Margo Puuram gathered fragments of jewellery, a coin, burnt stones and animal bones from the cultural layer of the settlement site (Fig. 4). A year earlier a cemetery from the vicinity of the settlement site was discovered (Lõhmus & Ots 2011, 234–235).

Fig. 3. Andres Vindi is removing the surplus soil under the block of Sargvere hoard in order to start the cleaning of the hoard in the laboratory conditions.

interest is concentrated in the counties of Lääne, Järva and Rapla. During his surveys he discovered nine settlement sites (Nos 61, 68, 69, 72, 82, 92, 93, 95, 96) and a cemetery (No. 94).

As usual, several landscape surveys were carried out on the historic territory of Setomaa (this year in Võrumaa and Põlvamaa). These expeditions were led by Arvis Kiristaja (MTÜ Arheoloogiakeskus) and Anti Lillak (TÜ) (Lillak 2011). These resulted in eight new sites (Nos 87, 121–127) and improved our knowledge about the settlement pattern from the Late Iron Age to the Modern Period.

Marge Konsa (TÜ) led a field survey to the vicinity of Madi cremation cemetery. Altogether five new sites from various periods were located: a settlement (No. 114) and four stray finds (Nos 115, 117–119).

Since 2006 when Andres Tvauri received an ETF grant to work on 'Tar and lime production in Estonia during the prehistoric, medieval and modern times' (Est. Tõrva-ja

INSTITUTIONAL LANDSCAPE SURVEYS

In 2011 the majority of new sites were discovered during field surveys. In several of them (e.g. Jägala Jõesuu V settlement site; see also Kiudsoo *et al.*, this volume; Tamla *et al.*, this volume) salvage excavations were carried out immediately.

Andres Vindi – a technician at the University of Tartu – has demonstrated his ability to find new sites many times before. This year his field surveys led him to Jõgeva, Järva, Pärnu, Tartu, Valga, Viljandi and Võru County. Altogether 43 sites were discovered during various expeditions that he initiated or participated in. His finds cover the time span from the Stone Age to the Modern Period and from settlement sites to cemeteries. One interesting find was a Stone Age/Iron Age settlement site at Tooma (No. 79) at Jõgeva municipality in Jõgeva County. The site is remarkable for its location on a moraine island in a marsh. Several fragments of hand-made pottery and flint debris were gathered there. Also an inhumation burial was located there (Fig. 5). The date of it is not known yet. Among Andres Vindi's finds were also two tarand-graves Lutike I and Lutike II (Nos 109, 110; Fig. 6).

Archaeologist Mati Mandel's (AM)

lubjatootmine Eestis muinas-, kesk- ja uusajal) (until 2009) he has focused on various manufacturing sites in Estonia. This interest has led him to discover new glass manufacturing sites at Laasme in Puurmanni municipality in Jõgeva County (No. 75) and Siniküla in Laeva municipality, Tartu County (No. 102).

In recent years researchers' interest in Järva County has risen. This year, in addition to Mati Mandel, a bachelor student from the University of Tartu, Liivi Varul, organised an expedition to the southern part of the county. Altogether three settlement sites (Nos 65, 66, 70) and three stray find sites (Nos 60, 62, 64) were discovered. All of these sites contained wheel-thrown pottery dating from the Middle Ages and the Modern Period. Traces of prehistoric activities were also detected from Koeru (Nos 58, 59) and Koggi (Nos 61, 68, 69, 71, 72) municipality. A constant interest of Riina Juurik (TÜ) in Pärnu County resulted in two new stray finds and a settlement site from the Iron Age and the Middle Ages (Nos 88, 90, 91).

Similarly to Järva County, Ida-Viru has been in the focus of field surveys in the last couple of years. In 2011 a field survey initiated by Tõnno Jonuks (EKM) and Vallo Reimaa (Museum of Iisaku) was carried out at Ida-Viru County. Altogether 33 new sites were discovered (Nos 15–42, 44–45, 47–53, 55–57), whereas, 31 of these were cup-marked stones (Figs 7, 8) (see also Veldi & Jonuks, this volume). So far no organized survey in order to detect cup-marked stones in Ida-Viru County had been done. The surveys conducted in the 1970s to 1980s (see Lang 2006) did not reach there; only archaeologists Toomas Tamla and Ain Mäesalu and some local historians have focused their interest on this region. These landscape surveys demonstrate how incomplete our

understanding about the distribution of cup-marked stones is. All the stones are under temporary protection of the National Heritage Board. In addition to Ida-Viru County four more cup-marked stones (Nos 83–86) were located in Lääne-Viru County by Ingmar Noorlaid (MA) and Tõnno Jonuks.

There were several sites that were discovered in Jõelähtme municipality. Four complexes of fossil fields were detected by Aivar Kriiska (Nos 5–8). During the research of Jägala Jõesuu fossil fields and a Stone Age settlement site Jägala Jõesuu V (No. 9) were discovered; and salvage excavations, led by Aivar Kriiska and Raito Roog, were carried out there immediately.

ABOUT THE TABLE

A site is reported in the table only if finds or other kind of information has reached the archaeological collections both at the University of Tartu and Tallinn University and local museums. Sites are listed according to the county of their location. The name of the site usually refers to the village it was found. More detailed information about the new sites can be obtained from the archaeology archives at the University of Tartu and Tallinn University.

Acknowledgements: This study was supported by the European Union through the Regional Development Fund (Centre of Excellence CECT). We are grateful to all archaeologists who contributed to the development of the table.

2011. AASTA MAASTIKUINSPEKTSIOONID JA AVASTATUD MUISTISED

Mari Tõrv ja Mirja Ots

Käesoleva artikli tabelis (tabel 1; jn 1) on esitatud 2011. a arheoloogilistel uuringutel ja tavakodanike poolt avastatud 128 uut muistist. Nende hulgas on 16 matmispaiaka, 44 asulakohta, 34 lohukivi, kaks klaasitöötlusobjekti, kolm peitleidu, neli muistset pöllujäänuuste kompleksi ja 28 juhuleidu. 2011. a leidis kõige enam uusi objekte Andres Vindi (TÜ) (43), kellele järgnes Ida-Virumaal tehtud ulatusliku inspeksiooniga Tõnno Jonuks (EKM) (35 uut muistist). Tehtud avastused võib laias laastus jagada kaheks: (1) tavakodanike leitud ja (2) professionaalsete arheoloogide poolt tuvastatud leiu.

Viimastel aastatel on suurenenud tavakodanike tehtud avastuste hulk. Sel aastal suurenedes arheologia kogud nõnda 16 ühiku võrra, millest enamik leide tehti metallidetektori abil (14). Sealjuures on suurem osa neist avastatud Harjumaalt. Muutused uue muinsuskaitseaduse jõustumisega 2011. a näevad ette, et kultuuriväärtusega muistiseid tohivad otsida vaid koolituse läbinud ja lubadega detektoristid ja seega on neil ka teada, kuidas leiu puhul käituda ja keda teavitada.

Dimitri Sutov leidis Tõrvajõelt Vaivara vallast tulekivist nooleotsa (nr 54), Rene Vinkler leidis Anija vallast jahvekive (nr 1). Kõik ülejää nud leiu olid tehtud metallidetektorit kasutades. Roland Kolk avastas Harku vallast Humala külast muinasaja lõppu kuuluva ehetest koosneva peitleiu (nr 2), samast lähedalt tuli ka üks Rooma münt (nr 3). Mõlemad leiuid dokumenteeris Aivar Kriiska (TÜ). Lisaks nimetatud peitleidudele saadi neid veel Läänemaalt Kinksi külast (nr 81) ja Järvamaalt Sargverest (nr 67; jn 3). Harjumaalt leiti samuti kaks kaaluvihti (nr 4) ja R. Vinkleri poolt Kadja külast Kõue vallast pöletusmatustega kalmistu (nr 10; jn 2), mille dokumenteeris Mauri Kiudsoo (AI). Sarnase kalmistu (nr 14) leidis Vaida külast Aivar Raudkepp. R. Vinkler avastas ka Partsare III (nr 13) ja koos Rait Hutroviga Linnakse II kalmistu (nr 11). Erkki ja Veiko Heinsalu leidsid Linnakse III kalmistu. Ida-Virumaalt Permiskülast leidis Andrei Selvestov prunksiaegse nooleotsa (nr 43).

Kaks uut paika leiti ka Järvamaalt. Koosi talu juurest Oisu vallast leidis Margus Tepner rauaaegse kalmistu (nr 63). 2007. a avastatud ja uuritud Sargvere asulakohast leiti aga detektoriga Liivi sõja aegne ehteare (nr 67; jn 3). Pärnumaal Pappaare külas sattus Margo Puuram kuivenduskraavi kaevamistel hilisrauaaegsele asulakohale (nr 89; jn 4).

Enamik 2011. a uutest muististest tuvastati arheoloogilistel välitöödel – maaстikuinspektsoonidel ja teistel uuringutel ning vaid üksikute leidudega kaasnesid kohesed päästekaevamised.

Nagu juba eespool mainitud, demonstreeris Andres Vindi oma oskust maaстikul muistiseid leida ka 2011. a. Sel aastal jõudis ta oma inspektsooniidega Jõgeva, Järva, Pärnu, Tartu, Valga, Viljandi ja Võru maakondadesse. 43 uue objekti hulgas oli erinevatesse perioodidesse kuuluvaid asulakohti, kalmistuid ja juhuleide. Üks huvitavamaid leide oli Tooma kivi- ja rauaaegne asulakoht soosaarel, kust lisaks keraamikale lokaliiseriti ka üks laibamatus (nr 79; jn 5). Tema leidude hulka kuulus ka kaks tarandkalmet Lutike I (jn 6) ja Lutike II (nr 109, 110). Arheoloog Mati Mandel tuvastas Läänenemaal, Järva ja Raplamaal 9 uut asulakohta (nr 61, 68, 69, 72, 82, 92, 93, 95, 96) ja ühe matmispaiaga (nr 94).

Sarnaselt eelnevatele aastatele tegid Arvis Kiristaja (MTÜ Arheoloogiakeskus) ja Anti Lillak (TÜ) inspektsoone vanal Setumaal (Võru ja Põlva maakonnas), kogudes teavet kaheksa uue muistise kohta (nr 87, 121–127). Marge Konsa (TÜ) teostas Madi kivikalme lähiümbruses arheoloogilist luuret, mis päädis ühe asulakoha (nr 114) ja nelja juhuleiu (nr 115, 117–119) tuvastamisega.

Alates 2006. a on Andres Tvaauri (TÜ) huvitunud tööstusmälestistest. Ka sel aastal lokaliseeris ta kaks klaasitöötustega seotud paika: Laasme Puurmannis (nr 75) ja Siniküla Laeva vallas (nr 102).

Viimastel aastatel on kasvanud arheoloogide huvi Järvamaa vastu. Sel aastal tegi Tartu Ülikooli baka-laureuseõpppe tudeng Liivi Varul inspektsooni Lõuna-Järvamaale, kogudes materjali kolmelt asulakohalt (nr 65, 66, 70) ja saades kolm juhuleidu (nr 60, 62, 64). Muistset inimese tegevusjälgi avastati samuti Koeru (nr 58, 59) ja Koigi vallast (nr 61, 68, 69, 71, 72). Sarnane huvi tõus on märgatav ka Ida-Virumaa puul. 2011. a teostasid Tõnno Jonuksi ja Vallo Reimaa (Iisaku Muuseum) seal lohukividile kaardistamist. Selle tullemusel saadi teavet kokku 33 uest muistisest (nr 15–42, 44–45, 47–53, 55–57), millest 31 olid lohukivid (jn 7, 8). Lisaks tuvastati lohukive ka Lääne-Virumaalt (nr 83–86). Riina Juuriku inspektsoonidel Pärnumaal avastati üks rauaaegne asulakoht ja kaks juhuleidu (nr 88, 90, 91). Jõelähtme vallas avastati 2011. a neli pöllujäänuuste kompleksi (nr 5–8), kusjuures Jägala Jõesuu pöllukompleksi uuringute käigus avastati kiviaegne asula Jägala Jõesuu V (nr 9), mille päästekaevamised toimusid samal aastal.

Artiklike lisatud tabelis leiavad kajastamist üksnes need leiu, mille kohta on andmed esitatud arheoloogiakogudesse või Muinsuskaitseametile. Muistise nimi on tavaselt määratud küla järgi. Lisainfot tabelis toodud muististe kohta saab TÜAK ja AI arheoloogiaarhiividest.
