INTRODUCTION

The article summarises new archaeological discoveries and prominent stray finds that have reached institutional collections in Estonia during 2014. The table consists of 106 new places, from which several are multi-layered complex sites including traces of different objects. Altogether 112 new sites are listed: 51 settlement sites, 13 hoards, nine cemeteries, three sacrificial places, one hill fort, one manufacturing site, and 34 stray finds (Table 1; Fig. 1). As usual, the data about new sites is introduced in two groups: first the landscape surveys organised by archaeologists and institutions, and secondly, the discoveries made by licensed searchers using metal detectors. Regarding the number of new sites and the persons involved in searching activities in 2014, the results were similar to last year (Rammo *et al.* 2014, 246).

INSTITUTIONAL LANDSCAPE SURVEYS

The southern part of Estonia was under close inspection this year and several research trips were organised by archaeologists of the University of Tartu. 2014 was the last year of fieldwork of the cross-border project ‘Archaeology, authority and community’ (hereafter AAC; e.g. Valk *et al.* 2014). The main focus this time was on the historical parishes of Kambja and Nõo and several research trips there were organised by Allar Haav, Anti Lillak and Andres Vindi (TÜ). According to the present administrative division the discovered sites are located mainly in Tartu County, and in lesser extent also in Põlva County. 23 settlement sites and one burial place (no. 87) were discovered in the counties and on the basis of collected pottery sherds the sites have been dated to the relatively long period reaching mainly from the Late Iron Age until the Modern Period (Table 1; Fig. 2).

Also trips in the historical parishes of Torma (Kristjan Sander), Kodavere (Andres Kimber), Kanepi (Alo Ervin), Iisaku (Maria Smirnova, Raido Roog), and Karula (Pikne Kama) were carried out within the AAC project. This fieldwork was partly sequel to the trips carried out

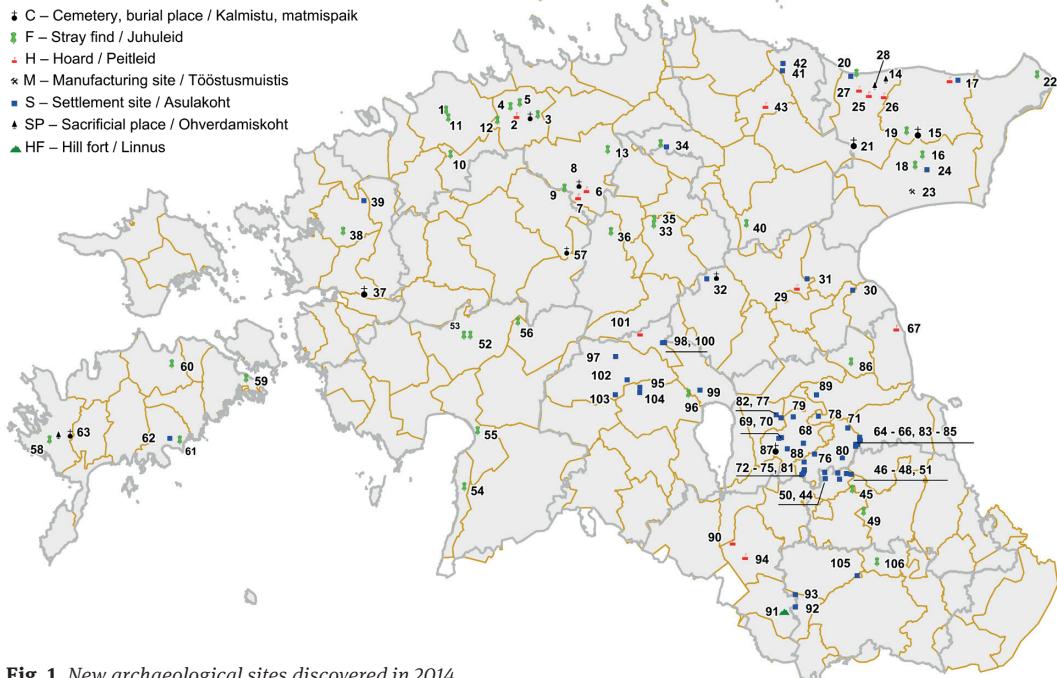

Fig. 1. New archaeological sites discovered in 2014.

Jn 1. 2014. aastal avastatud muistised.

Map / Kaart: Kalle Lange

in previous years with the main aim to inspect already known sites and to ascertain ambiguous archival information (Valk *et al.* 2014, 229). In addition, two new settlement sites (nos. 92, 93) and a Viking Age hill fort on Madsa Liinumägi (no. 91; Fig. 3) were ascertained by PhD students Pikne Kama (TÜ) and Maarja Olli (TÜ) in Karula parish. In Iisaku parish, Maria Smirnova and Raido Roog located a new settlement site (no. 24) and, on the basis of slag finds, an iron production site (no. 23) that cannot be precisely dated. As a result of the fieldwork of the AAC project in three years (i.e. 2012–2014) information about ca. 170 new sites has been published in the AVE overview articles (cf. Table 1; Ots & Rammo 2013; Rammo *et al.* 2014).

In 2014, relatively lot of new data have been collected about the Stone Age. At least one of the settlement sites discovered in the course of inventories in Nõo parish described in the previous paragraph, contains Stone Age finds (in Külasema village, no. 70). In addition to other activities, Andres Vindi continued looking for traces of Stone Age settlement and as a result, he located four new places in Tartu County (nos. 69, 77, 82, 88) and one in Võru County (no. 105). At least two of these were once islands of past lakes (nos. 69, 105; Võrtsjärv and Vagula respectively) complementing the water bound settlement pattern known already from previous studies (Ots & Rammo 2013, 299; Rammo *et al.* 2014, 247). Together with Kristiina Johanson (PhD student, TÜ) and Aivar Kriiska (professor, TÜ) A. Vindi also participated in the research team that discovered three Stone Age sites in Viljandi County (nos. 98–100) and one in Jõgeva County (no. 30). In Lääne-Viru County PhD student Kristjan Sander (TLU) located two new settlement sites (nos. 41, 42) in Linnuse village in the vicinity of a well-known Stone Age site Kunda Lammasmägi. The collections of the University of Tartu were supplemented with three stone axes and two adzes as stray finds from Saustinõmme (no. 12; Harju County),

Purtse Suurekivi (no. 20; Ida-Viru County), Rägavere (no. 34; Järva County), Jõeküla (no. 96; Viljandi County), and Piigaste (no. 45; Põlva County). Two of these (nos. 12, 45) were found already some decades ago, but reached the archaeological collections only in 2014 (e.g. Ervin 2015).

Marge Konsa organised a survey in Viljandi County to complement the settlement history in the northern part of the county. Altogether five new settlement sites were discovered and the collected finds are dated to various periods from the Stone Age until the Modern Period (nos. 95, 97, 102–104). Arvis Kiristaja located a new settlement site in Seljaküla (no. 39, Lääne County).

CONTRIBUTION MADE BY USERS OF METAL DETECTORS

In 2014, 276 permits for searching with detecting tools were issued by the National Heritage Board (hereafter MA), which are 83 licenses more than the year before (Rammo *et al.* 2014, 247). Altogether 110 archaeological finds or find assemblages unearthed by detectorists were documented in the MA. Data about these finds presented in Table 1 has been gathered mostly from the reports and reviews submitted by licensed searchers to the MA, and also from expert opinions compiled by archaeologists. Some of the assemblages containing numerous stray finds collected with the help of search devices still need further studies by archaeologists to ascertain whether they originate from an archaeological site. The majority of the artefacts have reached the archaeological collections of the universities (TÜ, AI) and museums (e.g. Iisaku Museum, Pärnu Museum, Haapsalu and Läänemaa Museums).

The most actively searched regions in Estonia continued to be Ida-Viru and Harju Counties (cf. Ots & Rammo 2013, 300; Rammo *et al.* 2014, 247). In Harju County 13 new discoveries were made by detecting devices and among these two new possible burial places and three hoards can be named. The burial place in Kõue (no. 8) has been dated to the Late Iron Age, rather to the second part of the period and the finds can be related with cremation tradition. The other putative Late Iron Age burial place in Kurna (no. 3) needs additional archaeological survey to ascertain the essence and borders of the site (Kurisoo 2014). Two Viking Age hoards from Kõue (nos. 6, 7) supplement the previously known Viking Age hoard from the same site found already in 2013 (Tamla & Kiudsoo 2014). Among stray finds, a metal ring from Kumna (no. 1) and a fragment of a socketed axe from Kurna (no. 5) dated to the Bronze Age can be pointed out.

It can be noted that several new finds from the Bronze Age have been found in recent years, also in this table five items have been recorded (in addition to the two finds from Harju County named in the above sentence: nos. 22, 53, 55). Other stray finds from Harju County mainly consist of fragments of copper alloy jewellery and date from the Late Iron Age and the Middle Ages (nos. 3, 4, 9–13).

In Ida-Viru County, 12 places have been listed in the table with 15 find assemblages discovered by detectorists. Again, two burial places in Atsalama (no. 15) and in Piilse (no. 21) from the Late Iron Age and the Viking Age respectively, are noteworthy. In both sites, together with ornaments, burnt bones were collected, thus cremation tradition was common there. Three hoards found by Mikhail Stadnik and Eduard Kessel in Varja and analysed by archaeologist Mauri Kiudsoo (Kiudsoo & Leimus 2014a) have been dated to the Viking Age (nos. 25–27). The hoards and other finds (no. 28) discovered in Varja can be related with ritual activities and sacrifices over a longer period (Kiudsoo this volume). Stadnik and Kessel reported about another similar find place in Aa (no. 14). The site is located relatively close to Varja and is actually not new – sacrificial finds dated to the various periods have been found from this field already since the end of the 19th century (known by the toponym Alulinn; Oras 2014). Obviously in Aa different votive assemblages similar to Varja could be distinguished as well (*ibid.*). The hoard from Konju (no. 17; Fig. 4) is dated to the 15th century and it is remarkable, as from that period only few similar finds are known so far (Kiudsoo & Leimus 2014b). In the course of archaeological fieldwork led by Anu Kivirüüt (MA) and Ingmar Noorlaid (MA), traces of an oven, *resp.* house were located in the find spot. Thus, a hint to the hiding circumstances of the coins and pendants has been provided (Kivirüüt 2014). Other assemblages of metal finds found in Ida-Viru County and designated in the table as stray finds (nos. 16, 18, 19) have been dated to the Late Iron Age until the Modern Period. These consist mainly of

Fig. 4. Bracteate pendants from Konju hoard (no. 17).

Jn 4. Konju aardest pärit rinnalehed.

(AI 7262: 36, 37, 35, 34, 32, 38, 33.)

Photo / Foto: Viire Kobrusepp

metal jewellery and fragments of weapons. Exceptional are a Bronze Age palstave from Narva airfield (Soldina village, no. 22; actually found already in 2013) and book clasps from Lipniku (no. 18).

In other parts of Estonia, less information about detector finds has been gathered and mostly these are listed as stray finds. In Lääne-Viru County one hoard of coins (no. 43) from the 16th century and stray finds of various periods (no. 40) were reported. On Saaremaa Island, Tarvo Vaher made five discoveries dating mainly from the Late Iron Age until the Modern Period (nos. 58–62). Only one of them can be related with the cultural layer of a settlement site (Püha village, no. 62). Marika Mägi excavated a looted Iron Age sacrificial place and cemetery at Viidumäe (no. 63; Mägi this volume). Pärnu County is represented with five stray finds. A spearhead and a palstave date from the Bronze Age (no. 53, 55), some artefacts from the Viking Age (nos. 52, 54), and other finds are from the Middle Ages and the Modern Period (nos. 52, 56). In Lääne County in addition to a single coin (no. 38), a burial place (no. 37) in Kabeli can be named; both finds date from the Late Iron Age. In Järva County assemblages of fragmented jewellery dated to various periods (nos. 33, 35, 36) and in Rapla County only one Late Iron Age burial place (no. 57) have been found.

In the southern part of Estonia, metal artefacts collected in fields were given over by Mati Jallai (no. 49; Põlva County), Andres Keske (no. 31; Jõgeva County), Detectorists' Club of Jõgevamaa (no. 32; Jõgeva County), and Arnold Kuld (no. 93; Valga County). First of these assemblages contain mainly jewellery of different dates and various sites, unfortunately impossible to locate more precisely at the moment. For example, there is a horse figurine (Fig. 5) that might have been used as weight in the Late Iron Age (Tvaauri 2014). Other assemblages originate from the cultural layer of settlement sites. Tõivere assemblage (no. 32) may also contain finds of a putative burial place. Detectorists' club 'Kamerad' together with Heiki Valk found a 6th – 7th c narrow-bladed axe near Kirumpää (no. 106; Fig. 6, see Tvaauri 2012, 124). A noteworthy find is a golden coin (no. 86; ducat, 1598) from Vara village (Tartu County), discovered by Igor Tšakuhhin (Kiudsoo 2014).

In addition to the hoards mentioned above (particularly in the paragraphs about Harju and Ida-Viru Counties), in southern part of Estonia four assemblages dating from the 16th–17th centuries (nos. 29, 67, 90, 94) and one from the Viking Age were discovered (no. 101). A unique find assemblage was detected by A. Keske at Kivistjärve (no. 29). The whole find assemblage was removed from the earth as a block (i.e. together with supportive soil) by

Fig. 7. Kivijärve hoard (no. 29) consisted of a birch bark box filled with numerous spiral tube decorations, partly edged with bells. Also remains of a blue textile item made of wool were preserved, possibly originating from a festive head dress.

Jn 7. Kivijärve peitleid koosnes kasetohust vakast, mis oli täidetud erinevate spiraalrudest mustritega, mida ääristasid kuljused. Samuti oli säilinud jäänuseid sinisest villasest tekstiilist, mis võivad pärineda pidulikust peakattest.

Photo / Foto: Riina Rammo

archaeologists Ester Oras and Andres Tvauri and the final cleaning process was carried out in laboratory conditions. Thanks to the careful handling, remains of a birch bark box with numerous spiral tube decorations, bells and textile fragments were removed from the soil layer by layer. The excavations in the laboratory were documented with photos and 3D modelling that enables us to gather as much information as possible (Rammo 2014; Rammo & Kangert 2015). Most likely it contained a festive female head dress (Fig. 7; cf. Kiudsoo & Ratas 2005).

ABOUT THE TABLE

A site is reported in this table only if the relevant finds and information has reached the archaeological collections either at the University of Tartu, the Institute of History of the Tallinn University, or the local museums. Sites are listed according to the county of their location. The name of the site usually refers to the present-day village where it was found. More information about the sites listed in the table can be obtained from the archaeology archives of the University of Tartu (TÜAK) and the Institute of History (AI) of the Tallinn University.

ACKNOWLEDGEMENTS

Andres Vindi kindly helped us to systematise information and date the collected finds. We are grateful to all archaeologists who contributed to compiling the table and to Viire Kobrusepp, Anti Lillak and Pikne Kama for the photos. This study was supported by institutional research funding IUT20-7 of the Estonian Ministry of Education and Research.

Table 1. New archaeological sites discovered in 2014.**Tabel 1.** 2014. aastal avastatud muistised.

2014. AASTA MAASTIKUINSPEKTSIOONID JA AVASTATUD MUISTISED

Riina Rammo, Nele Kangert ja Kristi Tasuja

2014. aastal avastati 112 uut muistist ja leidu 106 kohast (jn 1; tabel 1). Nende hulgas on tabelis 1 loetletud 51 asulakohta, 13 aaret, üheksa kalmistut, kolm ohvrikohta, üks linnamägi, üks tootmiskoh ja 34 juhuleidu. Nii leidude arv kui ka leidjad on nimetatud aastal sarnased 2013. aastale (Rammo *et al.* 2014, 246). Andmed on tavapäraselt esitatud kahe osas: esmalt arheoloogilised inspekteeritud ja seejärel otsinguvahendiga tehtud avastused.

2014. aasta oli viimane AAC projekti välitööde aasta. Projekti inspekteeritud raames dokumenteeriti enim uusi muistiseid Tartu ja Põlva maakonnas, sest projekti fookuses olid nimetatud aladele jäavat ajaloolised Nõo ja Kambja kihelkonnad. Nimetatud aladelt koguti peamiselt Andres Vindi, Allar Haava ja Anti Lillaku organiseeritud retkedel maapinnalt leide 23 asulakohast (jn 2) ja ühelt külakalmistult (nr 87), millest enamikku võib esialgsetel andmetel dateerida pikka perioodi nooremast rauaajast kuni uusajani. Projekti välitööde käigus avastati kaks uut asulat (nr 92, 93) ja üks viikingiaegne linnamägi (nr 91; jn 3) Karula kihelkonnas (Valgamaa) ning asulakoht (nr 24) ja ebamäärase dateeringuga rauasulatuskoht (nr 23) Iisaku kihelkonnas (Ida-Virumaa).

Rohkesti koguti uut teavet kiviaja asustuse kohta. A. Vindi avastas lisaks eelmises lõigus mainitule veel neli uut kiviaegset asulakoha Tartumaal (nr 69, 77, 82, 88) ja ühe Võrumaal (nr 105). Kahel juhul on tegemist kunagiste saareasulatega, mis täiendavad juba eelnevatel aastatel kogutud andmeid kiviaegsete veesidusast asustuspildist Lõuna-Eestis. Koos Kristiina Johansoniga ja Aivar Kriiskaga kaardistas A. Vindi veel neli asulat Viljandimaal (nr 98–100) ja ühe Jõgevamaal (nr 30). Kaks kiviaja asulat (nr 41, 42) Kunda Lammasmäe piirkonnas avastas Kristjan Sander. Lisaks jõudsid TÜ kogudesse kolm kivikirvest ja kaks talba (nr 12, 20, 34, 96, 45). Marge Konsa organiseeritud Põhja-Viljandimaa inspekteeritud tulemusena avastati viis uut pikaajaliselt kasutusel olnud asulakohta (nr 95, 97, 102–104). Arvis Kiristaja lokaliseeris asulakoha Seljakülas Läänemaal (nr 39).

Detektoristide avastusi on kõige rohkem teada Harjumaalt ja Ida-Virumaalt (tabel 1). Neist moodustavad suure osa otsinguvahendi abil kogutud metallsemed (jn 5, 6), mida pole veel jõutud seostada konkreetsete muististega. Reeglina pärinevad sellised leiuokogumid suhteliselt pikast ajavahemikust muinasajast uusajani. Viimaste aastate jooksul on muuhulgas leitud mitmeid prонksiaega dateeritud esemeid (nr 1, 5, 22, 53, 55). Hobitsijate leidudega seoses on kõige rohkem uut teavet kogunenud esialg matusepaikade ja asulakohtade kohta. Sageli maaharimisega lõhutud põletusmatustega kalmistuid ja oletatavaid matusekohti, mis kõik võiksid kuuluda kogutud ehete ja relvade põhjal nooremasse rauaaega, avastati vähemalt seitse: Harjumaal Kurnas (nr 3) ja Kõues (nr 8), Ida-Virumaal Atsalamas (nr 15) ja Piilses (nr 21), Läänemaal Kabelis (nr 37), Saaremaal Viidumäel (nr 63) ja Raplamaal Sonnis (nr 57). Võimalik külakalmistu tehti kindlaks ka Jõgevamaal Tõiveres (nr 32). Asulakohadega on arheoloogid seostanud Konju aarde (nr 17) leiuokoha Ida-Virumaal, kust avastati majajäänused, samuti Tõivere (nr 32) ja Sätsuvere (nr 31) leiuokohi Jõgevamaal, Püha (nr 62) leiuokoha Saaremaal ning Mürgi (nr 93) leiuokhta Valgamaal. Kõik need asulakohad on leidude põhja dateeritud enamasti hilisrauajast kuni uusajani.

Aardeleide avastati otsinguvahendiga vähemalt 13 juhul. Neli neist pärinevad Ida-Virumaalt ning neist oma-korda kolm viikingiaega dateeritud aaret Varjast (nr 25–27). Paika peetakse koos teiste seal kogutud leidudega (nr 28) pikema perioodi väitel kasutatud ohvrikohaks (Kiudsoo, käesolev kogumik). Sarnased kohad, kuhu on muinasaja välitel esemed ja esemekogumeid ohverdatud, asuvad ilmselt ka Virumaal Aas (nr 14) ja Saaremaal Viidumäel (nr 63), neist Aa oli Alulinna nime all juba varem teada. Ida-Virumaa neljas aare, mis pärineb 15. sajandist, leiti Konjust (nr 17; jn 4) ja oli töenäoliselt peidetud hoonesse. Sellest perioodist on teada äärmiselt vähе peitvarasid. Harjumaa kolmest viikingiaegsest aardest kaks pärinevad Kõuest (nr 6, 7) ja üks Kurnast (nr 2). Viikingiaega on dateeritud ka üks aare Viljandimaalt Soomeverest (nr 100). Ülejäändub viis peitleidu on kõik 16.–17. sajandist. Peale ühe (nr 43, Lääne-Virumaa) on kõik pärit Lõuna-Eestist Valga-, Tartu- ja Jõgevamaalt (nr 29, 67, 90, 94). Esile võib tõsta Kivijärve leiuokogumit Jõgevamaalt, mis õnnestus välja puhastada laboritingimustes. Säilinud olid jäänused kasetohust vakast, mille sees asusid spiraaltorudest põimitud mustriribad. Vakas olnud tekstiilijäänused võivad pärineda kuljuste ja spiraaltorudest mustritega kaunistatud peaehtest (jn 7). Lisaks nimetatud aaretel leiti Tartumaalt Varalt üks kuldminek aastast 1598 (nr 86).

Tabelis kajastuvad leiud, mis on jõudnud avalikesse arheoloogiakogudesse ning mille leiuandmed on nõuetekohaselt esitatud.
