INTRODUCTION

The article summarises new discoveries made by users of searching devices and prominent stray finds that have reached institutional collections in Estonia during 2017. First, some changes in the structure of the article need to be explained. Previously, the final article of *Archaeological fieldwork in Estonia* was dedicated to the new monuments discovered within a calendar year. Results of institutional landscape surveys and finds collected by licenced hobby searchers or the public were introduced in one paper. This year we decided to separate the two types of fieldwork: an overview about institutional landscape surveys is given in the introductory article of the present journal (Russow *et al.*, this volume) and information of the finds discovered by licenced users of searching devices or any other finds made by people without professional knowledge has been gathered in the present writing.

Two main reasons for the restructuring can be pointed out. First, usually the aims, methods, and results of the surveys organised by archaeologists differ significantly from the fieldwork conducted by hobby searchers. Thus we found it rather challenging to present the collected data on a similar basis. Previously the aim of the article was introducing new monuments, but it is problematic and often even impossible to establish the type of the archaeological site the detector finds originate from, only on the basis of the collected artefacts. Consequently, some peculiar stray finds or sets of finds made by hobby searchers were left out of the overview. Secondly, the amount of the detector finds has increased remarkably. For instance, in 2011 only in 16 cases the detector finds reached the institutional collections (Lõhmus & Ots 2012, 268). The table about discoveries in 2017 (Table 1, Fig. 1) lists altogether 136 sites; it is approximately nine times more than six years ago. Thus, it is well-founded to compile an independent overview about the numerous detector finds.

ABOUT THE TABLE AND STATISTICS

The principles for compiling the table are similar to the previous years.¹ A site is reported in the table only if the relevant finds and information have reached the National Heritage Board, the archaeological collections at the University of Tartu, the Archaeological Research

¹ Sites are listed according to the county of their location. The name of the find spot usually refers to the present-day village where the finds were collected. The administrative division of Estonia was reformed in the beginning of 2018. The present table follows the new 2018 division.

Collections of Tallinn University, or local museums. This year the site type has been marked as stray find in all those cases where it was impossible to determine the nature of the putative monument at the present state of study. An addition to the table is the column for the expert(s), who has compiled the preliminary expertise of the finds. These expert opinions, which are stored in the archives of National Heritage Board, form the basis of the article.

The table is not finite and it does not contain all finds made by hobby searchers. Certainly not all information about discoveries has reached the authors, but also deliberate decisions about excluding certain objects were made. We did not list all individual stray finds, especially those, which are difficult to identify or date (e.g. metal objects of unknown function, single buttons, pipe cleaners, modern coins, pewter bullets, finds from the 19th–20th century, etc.), also finds with uncertain context were left out. On the other hand, we decided to include some records about discoveries made already in 2016, which reached the National Heritage Board later and have not been presented in previous year (Rammo *et al.* 2017, table 1).

In 2017, 484 permits for searching with detecting devices were issued by the National Heritage Board, that is 25 more than last year (Rammo *et al.* 2017, 197), thus the number of licenced searches has remained by and large the same. Altogether 120 acts for handing over the finds were signed by the hobby searchers and the MA, yet as one act may contain finds from several locations, it is difficult to evaluate the actual number of all find spots searched. However, the compiled table resulted in 136 records, each of them usually designating one location. Sometimes, if two finds or find assemblages from one location are clearly indicating different monuments, they have been listed separately (e.g. nos 93, 94). In general, the trends

characterising the geographical, temporal as well as typological distribution of collected objects are greatly similar to the previous years. The following overview introduces the finds first according to the period and secondly, some remarks about geographical distribution have been made.

BRONZE AGE – MIDDLE IRON AGE

An increasing number of finds from the Bronze Age (in Estonia, *ca.* 1800–500 BC) has been reported in the overview articles about new monuments and finds since 2014 (Rammo *et al.* 2015, 228; Rammo *et al.* 2016, 238; Rammo *et al.* 2017, 198; see Paavel 2017a for a detailed study of these finds). This trend was clearly recognisable also this year – altogether 11 Bronze Age metal objects were unearthed in Estonia. Most of the items are axes – five socketed axes (nos 24, 58, 88, 115, 117), two flanged axes (nos 44, 121), and two palstaves (nos 65, 104). In addition, a spearhead (no. 14) and a tutulus (no. 134) were found in Muusika (Harju County) and Maalasti (Viljandi County) respectively. The latter is especially noteworthy, as although tutuli were popular in various parts of Europe, up to date only one item from Estonia, the Tuula find (AI 7) was known to archaeologists. Maalasti tutulus (Fig. 2) is smaller and of more simple decoration than the Tuula item (Paavel 2017b). Incidentally, one socketed axe from the Bronze Age was found in Maalasti already in 2016 (Rammo *et al.* 2017, table 1: 93). Kristiina Paavel conducted field surveys in the find spots of the Bronze Age stray finds also this year (Russow *et al.*, this volume), but as previously, no traces of the occupation layers or burials of the period were discovered.

Another period, which has obtained more attention in recent years, is the Early Iron Age (in Estonia, 500 BC – 450 AD). The number of Roman coins has risen remarkably in the last few years (e.g. Kiudsoo 2013, 289; Koovit & Kiudsoo 2016, 71–72; Rammo *et al.* 2017, 198), but also jewellery, most notably brooches, have been found more often. No relevant coin finds can be reported this year; however, several brooches of the period have been recorded in the table. Eight items have been collected either as individual stray finds (nos 9, 48, 128) or as single items among larger assemblages consisting mainly of objects of a later date (nos 30, 53, 59, 68, 86). The earliest among them is the 1st century eye fibula of the main series (no. 68; Olli 2018). The brooches of this type were usually made of brass and imported from the Roman Empire (see Olli & Roxburgh 2017). In addition, four crossbow brooches (nos 9, 30, 48, 53) and three cross-ribbed brooches (nos 59, 86, 128) mainly from the 3rd–4th century can be named. The fragments of at least two iron socketed axes found in Varja and Voorepera may also originate from the Roman Iron Age or from a slightly later period (nos 49, 54). In two cases, abundant Roman Iron Age jewellery together with burnt bones was collected, clearly pointing to a burial place. In Meeri (no. 125), remains of a demolished *tarand*-type graves were ascertained (Olli 2017). In Urvaste (no. 136) the construction of the graves could not be detected (Valk *et al.*, this volume).

Objects from the Middle Iron Age (450–800 AD) have been discovered relatively rarely. This year, four ornaments or their fragments represent the mentioned period. A unique find in Estonia is the Ullaste disc

Fig. 2. Tutulus from Maalasti (no. 134).

Jn 2. Maalasti tutulus.

Photo / Foto: Jaana Ratas

brooch, discovered accidentally already years ago (no. 103). The gilded copper alloy brooch is dated to the 6th century and it originates from the island of Gotland (see Kiudsoo, this volume). Other objects are a simple 5th–6th century bracelet from Haljava (no. 2) and fragments of a decorative pin from the 7th–8th century (no. 91). According to archaeologist Ain Mäesalu (TÜ) a fragment of a gilded copper alloy item from Võrkla also dates from the Middle Iron Age (no. 96; Mäesalu, pers. comm.).

LATE IRON AGE – MODERN PERIOD

The vast majority of the find assemblages delivered to the MA consists of various metal items dated to the broad time span from the Late Iron Age (800–1200/1250) until the Middle Ages or the Modern Period. Approximately half of the records in the table belong to this group. Often the objects of these assemblages have been collected from the plough layer in a relatively large area. The problems related with such finds have been already noted earlier (e.g. Rammo *et al.* 2017, 200). Very often they could indicate a long-term settlement site or a multi-layered burial place. Many of those find spots need urgently more thorough studies to establish the presence of occupation layer as well as geographical and timely borders. Only in ten cases it has been assumed that the finds refer to the settlement site inhabited over a long period (nos 5, 37, 57, 74, 86, 94, 107, 129, 133, 135); two of them include also smithy remains (nos 5, 94). Actually, some of these settlement sites were known already earlier, but not scheduled as protected monuments yet (e.g. nos 57, 107, 133). Four find spots were probably one-time burial places mixed up by ploughing (nos 72, 102, 114, 123). For example, in Kõdüküla (no. 123, Tartu County) remains of Late Iron Age cremations as well as jewellery from the medieval and Modern Period were collected.

Most common finds comprising these assemblages are jewellery, various clothing accessories, for example belt fittings, and in lesser extent also tools and weapons. Very often the artefacts are fragmented – whether deliberately before the deposition (e.g. prehistoric grave finds) or accidentally after the burial (e.g. agricultural activities on the site or decay). Regrettably, the volume of the present paper does not allow for introducing all interesting finds here and only some trends and discoveries are pointed out. Since the usage of searching devices became more popular, the number of pewter jewellery has risen steadily (e.g. Ratas & Kiudsoo 2017, 66). Also in this year relatively numerous ornaments, most notably pendants, made of pewter should be highlighted. Especially in the villages Varja and Voorepera (Ida-Viru County) several pewter pendants were unearthed (e.g. nos 49, 50, 53, 54; Fig. 3; Tasuja 2017).

Fig. 3. Pewter pendants from Voorepera (no. 54).
Jn 3. Tina-pliid sulamist ripatsid Voorepera külast.
Photo / Foto: Nele Kangert

An exceptional find assemblage consisting only of weapons was taken out by means of searching magnet from the Väike-Emajõgi River in Alamöisa village (no. 131, Valga County). Numerous axes as well as spearheads and a helmet fragment have been dated to the various periods from the Late Iron Age until the Modern Period (Mäesalu, pers. comm.).

Two among the largest assemblages in Table 1 were collected by detectorists' club 'Kamerad' in cooperation with archaeologist A. Mäesalu and the MA. Already for the third

year they were looking for 13th-century battlefields related to the invasion of Russian troops in the end of the 1260s in Lääne-Viru County (e.g. Kangert 2016; Rammo *et al.* 2016, 239). In the table, the finds of years 2016–2017 have been recorded, because all of these were handed over in the year 2017. In 2016 the fieldwork focussed on Kaarli village (no. 90), and the next year Võrkla village (nos 96, 97) was visited.

Viking Age and Final Iron Age finds

In the following paragraph, the results of the discoveries dated solely to the Late Iron Age, it means the Viking Age (800–1050) and the Final Iron Age (1050–1200/1250), have been summarised. In 2017, four hoards from the whole period were reported. One typical Viking Age hoard consisting of silver coins was discovered in Moldova (no. 31; Ida-Viru County), which is not far from the present-day Kohtla-Järve and its vicinity – a district richest in the hoards in Estonia (e.g. Kiudsoo 2016, 135–147; Kiudsoo & Tamla 2017, 75). Silver jewellery and coins forming probably another 11th-century hoard were collected in Kirisaare (no. 70, Järva County). While searching for the above-mentioned medieval battlefields, A. Mäesalu and detectorists' club 'Kamerad' discovered silver coins, a fragment of a silver ornament, and an animal-shaped figurine in Võrkla village (no. 97). A. Mäesalu (pers. comm.) suggests that all these items belong to an 11th-century hoard mixed up by ploughing. Especially noteworthy is the figurine, which represents the type believed to depict dogs or horses and possibly used as scale weights (Jonuks 2006; Jonuks & Johanson 2017, 150–151). Similar figurines are still rare in Estonia, but this is again an artefact type, the number of which is growing due to the use of metal detectors (Rammo *et al.* 2015, 229, fig. 5; Rammo *et al.* 2017, 200, fig. 6). The Võrkla figurine is extraordinary in comparison with other similar finds, because its design, as well as size and weight are bigger than usual (Fig. 4). The hoards from the middle of the 12th century are rare in Estonia and the deposit of coins from the mentioned period collected from Saanika village in Lääne County is remarkable (no. 85, see Leimus, this volume).

However, not only silver coins and jewellery can be regarded as valuables. A noteworthy discovery of iron blooms was made in Varja (no. 51, Ida-Viru County). After field-work directed by Mauri Kiudsoo (2018a), altogether nine rectangular iron blooms weighting approximately 22 kg in total were reported (Fig. 5); no occupation layer was detected on the spot, thus it was a deliberately hidden deposit find, left there in the 11th century (Kiudsoo 2018a; 2018b). Such currency

Jn 5. Rauakangid Varjast.

Photo / Foto: Mauri Kiudsoo

blooms ready for trading are still relatively rare in Estonia, but due to the metal detecting the number of relevant finds is increasing rapidly. M. Kiudsoo lists four relevant finds made in recent years in the Aa, Varja, and Voorepera villages (e.g. Kiudsoo 2018b; Kiudsoo & Tamla 2017, 78).

In Puru, a deposit consisting of eight bowls of copper alloy (no. 36, Ida-Viru County) was discovered. The find originates from the period of Danish-German crusades in the beginning of the 13th century, which is the transition period between prehistory and the Middle Ages in Estonian chronology. Such vessels are especially numerous in the historic Virumaa district. A study about Estonian bowls, earlier also known as ‘Hanseatic bowls’, has been recently published by Toomas Tamla and Heiki Valk (2017). The authors argue that these vessels, relatively often deposited in larger sets, were gifts from the King of Denmark (and the Church) to reward the loyalty to the local nobility in the newly subjected territories (Tamla & Valk 2017, 106). Another similar bowl from the same village has also been found already earlier (Ots & Rammo 2013, 301, fig. 5).

Of the 11th-century stray finds, a buckle from Muti (no. 100, Pärnu County) and a rare equal-armed brooch from Servääre (no. 41, Ida-Viru County; e.g. Kiudsoo 2016, 62–63) are worth mentioning. Weapons and tools are represented by three individual stray finds: an axe from Nina (no. 126, Tartu County) and a spearhead from Kahala (no. 3, Harju County) from the Viking Age. A mace head from Nurme (no. 17, Harju County), dated by A. Mäesalu to the 10th–11th century, is unique in the whole northern Europe (A. Mäesalu, pers. comm.). The mace heads are relatively rare in Estonia, up to 2017 only seven items from the 12th–13th century were known (see Mäesalu 2017a; 2017b, 88, 97; Mäesalu & Peets 2010).

Although the finds from the Viking Age and the Final Iron Age are numerous, only a few find assemblages have been attributed to certain monuments. The Viking Age burials may have been in Karksi-Nuia (no. 133, Viljandi County, Tvauri 2017), where relevant ornaments were collected already in 2016 together with finds related to a long-term settlement site (Rammo *et al.* 2017, table 1: 92). In seven cases the assemblages consisting mainly of Late Iron Age jewellery, belt fittings and occasionally also of iron tools or weapons have been interpreted as burial places (nos 15, 42, 78, 84, 105, 106, 122). Cremations are clearly indicated by the fragmented and burnt items; in two cases cremated bone fragments were collected as well (nos 84, 122). The remains of a Final Iron Age smithy and an iron smelting site were located in Vaiatu (no. 94, Lääne-Viru County); traces of long-term settlement were also present (see Kiudsoo, this volume).

Medieval and Modern Period

New information about medieval monuments was obtained as well and two solely medieval burial sites were located. First, Urvaste cemetery (no. 136, Võru County) has been mentioned already above together with Roman Iron Age grave goods found in the same spot. The inhumation graves have been dated to the 13th century (see Valk *et al.*, this volume). An intriguing discovery was made on Saaremaa Island (no. 118). While searching metal items, Tiit Lember noticed human bones in Länga. Archaeologists Anu Kivirüüt and Nele Kangert (both MA) unearthed two male skeletons during the fieldwork (Fig. 6). None of the finds can be connected with the skeletons beyond doubt; only a 14th–15th century crossbow bolt was found near one skull, but the relation with the skeleton remains unclear. However, according to the radiocarbon dating the burial took place roughly in the 14th century (Kivirüüt & Kangert 2018).

In addition, there are some individual finds and assemblages dated to the Middle Ages, which are worth mentioning. A seal stamp fragment of the Bishop of Tallinn from the 13th century (no. 38, Ida-Viru County, see Leimus, this volume) and an adorned metal spout (no. 98, Pärnu County) are rare finds in Estonian context. The latter belongs to a 15th-century lavabo – a vessel for washing hands (Russow 2018a; 2018b). Not all the finds have been made by using searching devices. An intriguing find is a knife-shaped object made of copper alloy (ca. 170 mm in length), which was accidentally found in the forest in Vea village (no. 130, Tartu County; Fig. 7). The item is adorned with anthropomorphic hangings fallen apart and found separately. The exact parallels are not known, but the item is obviously not of local provenance. It probably has arrived here from the east and it might date from the Middle Ages (Luik 2018).

Fig. 7. Knife-shaped object together with anthropomorphic hangings (no. 130).

Jn 7. Noakujuline ese koos antropomorfsete ripatsitega.

Photo / Foto: Ragnar Saage

Some find assemblages listed in the table have been dated to the Modern Period. Most numerous among the finds are again jewellery, belt fittings, parts of pipes, copper coins, and pewter bullets (nos 80, 124, 132); in one case a settlement site from the period has been reported (no. 92). The Early Modern Period is represented by a poorly preserved halberd from Kütke (no. 12, Harju County) and remains of a mixed up hoard from Vaiatu, which consists of silver and pewter jewellery (no. 93, Lääne-Viru County; Kiudsoo, this volume). A medallion dating from the end of the 17th or the beginning of the 18th century from Mõhküla is a rare find in Estonia (no. 60, Jõgeva County), although according to written sources these objects were mass-produced and widely spread in Europe (Russow 2018c). Such ornaments were used as religious souvenirs and prayer medallions, for example, on the obverse of the Mõhküla medallion Saint Benedictus of Nursia has been depicted (*ibid.*). In addition, a metal pipe bowl can be mentioned (no. 35, Ida-Viru County). Peculiar are also the remains of an Orthodox icon's silver sheet plaiting from Narva, which were deliberately crushed (no. 32).

GEOGRAPHICAL DISTRIBUTION

The geographical distribution of the reported find spots is the same already for years (e.g. Ots & Rammo 2013, 301). The most abundant information about finds comes from North Estonia, more exactly from Harju and Ida-Viru Counties – 41% of the finds recorded in Table 1 are from these two regions. According to the table the most searched micro-region is probably the district near Kohtla-Järve in Ida-Viru County mentioned already above; actually, the area has been under intense attention of detectorists already for several years. For example, Aa, Varja and Voorepera villages situated west of Kohtla-Järve, are represented with nine records in total (nos 24, 25, 48–54; see Kiudsoo 2016, 135–147). The data is continuously scant about South Estonia; especially Võru, Valga, and Viljandi counties are represented only with few discoveries. No finds from Põlva County reached the MA or the archaeological collections in 2017. It does not mean that searching devices were not used in those areas; looting archaeological monuments is still a problem and not only in South Estonia (e.g. Valk *et al.* 2013; Valk *et al.*, this volume a–b), but everywhere.

In addition to the above-mentioned Kohtla-Järve district, there are numerous other areas and places that have been searched intensively already for years. Sometimes several hobby searchers are visiting the same field repeatedly, resulting in many smaller find sets from one site or area. All these find assemblages need conservation treatment, expertise and storage, at the same time the amount of new information remains minimal, or even non-existent. Just to name some examples, such repeatedly searched sites are Sompa (no. 43) in Ida-Viru, Lõiuse (no. 107) and Nadala (no. 112) in Rapla, and Karksi-Nuia (no. 133) in Viljandi County. Moreover, managing and bringing together all these bits of data about one find spot that have been collected over years, can be challenging. Another trend, the results of which may be questionable considering new sites, is to search in the vicinity of already protected monuments. At least in two cases, burnt bones and metal items have been collected near the protected stone graves (nos 114, 122).

CONCLUSION

The article presents data about finds made mainly by hobby searchers by means of metal detectors in 2017. Table 1 contains 136 records of find assemblages or individual stray finds, which have reached institutional collections. Among the listed sites one can find seven hoards or deposit finds, 11 settlement sites, 15 burial places, and two manufacturing sites; the latter denoting remains of smithies and iron production sites. These monuments mentioned correspond only to 32 places in the table, because three of them are multi-layered complexes, where remains of two different monument types have been recognised (nos 5, 94, 133). The remaining 105 records have been marked as stray finds (F). Although some of them are stray finds (i.e. objects which are not related with an occupation layer or a certain monument), mostly these are find spots, which are still waiting for additional studies to ascertain the type of monument. Often items dating from different time periods have been collected from the plough layer of a large field, hence the dating of the site remains unclear.

On the one hand, the users of searching devices have notably contributed to the knowledge about the past. Many find types were rare or even not known before metal detecting became popular in Estonia. For example, the number of Bronze Age metal objects, Roman coins, Late Iron Age iron blooms, or pewter jewellery has increased abruptly and also the knowledge of past in some regions has deepened remarkably. On the other hand, the problems of looting, quality of documentation, and a huge amount of new data to manage and

work with are remaining. Especially, the amount of the new data is enormous: all the finds and documentation are waiting for a thorough study. Not only from the perspective of heritage protection, but also how to make all collected bits of information available and useful to the scientific community and wider audience. Research projects and papers based on the data collected by searching devices are urgently needed.

ACKNOWLEDGEMENTS

We are grateful to all who contributed to compiling the article, especially to Mauri Kiudsoo, Kalle Lange, Ain Mäesalu, Maarja Olli, Kristiina Paavel, Jaana Ratas, Kristi Tasuja, and Andres Tvauri and the authors of the photos. This study was supported by institutional research funding IUT20-7 of the Estonian Ministry of Education and Research.

2017. AASTA DETEKTORI- JA JUHULEIUD

Riina Rammo ja Nele Kangert

Artikkel annab ülevaate 2017. aastal Muinsuskaitseametisse, Eesti arheoloogiakogudesse või muuseumitesse jõudnud leidudest, millest enamiku avastasid metallidektoriga hobitsijad (tabel 1, jn 1). Varasemate aastatega võrreldes on AVE viimase artikli struktuur ja eesmärgid sel aastal muutunud. Kui eelnevalt keskendus artikkel eelkõige ühe kalendriaasta jooksul avastatud uute kinnismuististe tutvustamisele, siis sel aastal on peamine eesmärk anda ülevaade otsinguvhendiga kogutud ja ka juhuslikult leitud esemetest. Varasemates artiklites sisaldunud arheoloogiliste leire ja nendel avastatud uute muististe ülevaade paikneb kogumiku sissejuhatavas artiklis. Mainitud muutuste üks põhjusi on erinevused arheoloogiliste leire ja otsinguvhendit kasutades tehtud uurimisretkedega vahel ja raskused kogutud tulemuste ühitamisel. Teiseks on Muinsuskaitseametisse jõudnud detektorileidude arv viimastel aastatel jõudsalt kasvanud ja seetõttu on mõttelik suurendada ka tee- male pühendatud artikli mahtu.

Tabel 1 koondab artikli aluseks olevaid leiukohti. Tabelis esitatud ei ole täielik ülevaade kõikidest aasta jooksul otsinguvhendiga kogutud leidudest. Näiteks on välja jäänud ebamäärase otstarbe, konteksti ja dateeringuga leiud, 19.–20. sajandi leiud, samuti mõned üksikesemed (nt piibuorgid, vaskrahad, nööbid, tina-pliid sulamist kuulid). Kokku on tabelis 136 kirjet, millest seitse on aarde- või peitleiud, 15 matu-

sepaigad ja 11 asulakohad. Viimastega koos on kahel korral tuvastatud ka sepikodade ja rauasulatusega seotud objekte. 105 kirjet on määratud juhuleiiks, mis enamasti tähendab, et muistise iseloomu polnud olemasolevate andmete põhjal võimalik kindlaks teha. Uuendusena võrreldes varasemate aastatega on tabe lisatud lahter, kus on kirjas leidude kohta eksperdihihinnangu koostanud uurija nimi. Nendel töödel põhineb suures osas ka käesolev artikkel.

Jätkuvalt on tänu hobitsijatele kasvanud nii pronsiaegsete metallsemete kui ka rooma raua-aegsete ehetega arv. 2017. aastal leiti 11 pronsiaegset eset, millest üheksa olid kirved (nr 24, 44, 58, 65, 88, 104, 115, 117, 121), lisaks tulji välja odaots (nr 14) ja üks võrdlemisi väike tutulus (jn 2; nr 134). Viimane leid on eriline, sest Eesti arheoloogiakogudes oli siiani teada vaid üks, Tuulast leitud tutulus. Rooma rauaaja sõlgedest (nr 9, 30, 48, 53, 59, 86, 128) enamiku moodustavad 3.–4. sajandisse dateeritud amb- ja kärbissöled. Lisaks on teada üks 1. sajandi Rooma imperiumi aladel pärit silmiksölg (nr 68). Arvukalt selleaegseid ehteid saadi kahest rooma raua-aegset matusepaigast Meerilt (nr 125) ja Urvastest (nr 136). Käsitletavast aastast on teada ka neljä keskmisest rauaajast pärit ehet või nende katket (nr 2, 91, 96, 103).

Ligi pooled tabelis esitatud leiukogumitest on dateeritud väga laia perioodi alates nooremast rauaajast kuni uusajani. Sageli on sellised kogumid

korjatud suure põllumassiivi künnikihist, mis teeb nende seostamise kindla muistise või muististega keeruliseks. Siiski on eksperdid oletanud, et kümme neist viitavad pikaajalistele asulatele ja rauatootmisi seotud paikadele (nr 5, 37, 57, 74, 86, 94, 107, 129, 133, 135). Neljas kohas (nr 72, 102, 114, 123) oli ilmselt matusepaik, kus võib koos esineda nii muinasaja lõpu põletusmatuste kui ka keskaegse külakalmistu materjali. Kaks arvukalt esemeid sisaldanud leiu-kogumit (nr 90, 96, 97) korjas detektoristide klubि „Kamerad“, mis koostöös arheoloog Ain Mäesalu (TÜ) ja Muinsuskaitseametiga otsis juba kolmandat aastat Lääne-Virumaalt 13. sajandi lahingupaiku.

Suured esemekogumid sisaldavad arvukalt erinevaid asju ja nende katkeid: ehteid, vöösi, vähemal määral tööriisti ja relvi. Torkab silma, et tänu detektoriotsingutele on märkimisväärsest rohkem teada tina-plii sulamist valatud ehteid. Eriti rohkesti on nimetatud materialist ripatseid leitud Ida-Virumaalt Varja ja Voorepera küladest (jn 3; nr 49, 50, 53, 54). Relvaleidudest võib esile tõsta laiast ajavahemikust pärit kogumit, mis koosnes kirvestest, odaotstest ja kiivrikatkest (nr 131). Leiud saadi otsingumagneti abil Väike-Emajõest.

Kitsamalt nooremasse rauaaega on dateeritud üks oletatav viikingiaegne (nr 133) ja seitse hilisrauaaegset matusekohta (nr 15, 42, 78, 84, 105, 106, 122) ning üks sepikoda (nr 94). Selleaegseid aarde- ja peitleide on tabelis kuus. Kolm hõbemünrite ja -ehteid sisaldatat varandust on aareterikkast 11. sajandist (nr 31, 70, 97). Seevastu 12. sajandi keskpaigast, mil maapõue jäi Saanika mündiaare (nr 85), on peitvarasid teada vähe. Võrkla aardesse võis kuuluda lisaks müntidele ja ehtekatkele kaaluvihina kasutatud haruldane loomakujuke (jn 4; nr 97). Ida-Virumaalt Varja külast avastati varandus, mis sisaldas vähemalt üheksat kaubavahetuseks mõeldud kandilist rauakangi (jn 5; nr 51). Viimase paari aasta jooksul on sarnaseid leide tulnud piirkonnast päevalvalgele veel. Puru külast (samuti Ida-Virumaa) leiti kaheksa vasesulamist

kaussi (nr 36), mis pärinevad 13. sajandi alguse ristisõdade perioodist ja neid seostatakse Taani kuninga tegevusega Põhja-Eestis. Juhuleidudest võib esile tõsta pannalt (nr 100) ja võrdolgset sõlge (nr 41) ning 10.–11. sajandi nuiapead (nr 17).

Vaid keskaega dateeritud matusekohti on tabelis märgitud kaks: 13. sajandi kalmistu Urvastes (nr 136) ja kaks 14. sajandist pärit mehematust Saaremaalt (jn 6; nr 118). Haruldased leiud Eesti arheoloogias on Tallinna piiskopile kuulunud 13. sajandi pitsatikatke (nr 38) ja 15. sajandi kätepesunõu tila (nr 98). Ka vase-sulamist valatud noakujuiline ehe, mida kaunistavad antropomorfised ripatsid (jn 7; nr 130) ja mille päritolu võiks olla kusagil ida pool, võib pärineda keskajast. Uusaega kuuluvatest leidudest väärivad märkimist hellebard (nr 12), metallist piibukaha (nr 35), Püha Benediktusele pühendatud palvemedaljon (nr 60) ja ikooni hõbekatte jäänused (nr 32). Lisaks avastati üks rinnalehti ja tina-plii sulamist helmeid sisaldanud varauusaegne aare (nr 93).

Harjumaa ja Ida-Virumaa on jätkuvalt piirkonnad, kust jõuab Muinsuskaitseametini kõige rohkem teavet metallidetektoriga tehtud avastustest. Sealjuures on Kohtla-Järve linn ja selle ümbrus tõenäoliselt otsingutega kõige tihedamalt kaetud ala. Väga vähe on infot leidude kohta Eesti kõige lõunapoolsematelt aladel, samas kui märke detektoristide tegevuses on arvukalt. Teine probleem on samade paikade korduv külastamine ja otsinguvhendiga leidude korjamine. See toob kaasa teabe killustumise erinevate leiu-kogumite ja aruannete vahel. Samuti tuleb kõik kogutud leiud konserveerida, säilitada ning hinnata, samas kui uut informatsiooni see reeglina juurde ei anna. Kolmandaks on probleemaatilised uurimisretked kaitsealuste muististe piiride lähistel. Samas on tänu hobrotsijatele mitmed seni haruldased või sootuks puudunud esemeliigid hakanud sagedamini arheoloogiakogudesse joudma ja võimaldanud teha uusi järeldisi mineviku kohta.
